: Larry Lunsk

( LUNSK LARRY )

bject: Boyertown Landfill 1996 CME

yertown Landfill located on Merkel Road, Douglas Township, Montgomery County, closed hazardous waste landfill, was the subject of an annual Department RCRA mprehensive Groundwater Monitoring Evaluation (CME), in 1996.

e perator of this facility has failed to conduct groundwater monitoring for a me in excess of 3 years.

1995 the Department independently collected and analyzed groundwater quality mples from this facility. The results of these analyses indicated no nediate threat to public or environmental health and safety. The Department ans to conduct a similar, independent, analysis during fiscal year 1996/1997.

e Southeast Regional office of the Department has been actively pursuing forcement actions against the owner/operator of this facility, in an effort to our compliance with post-closure maintenance and monitoring requirements.

### **CME Worksheet**

# COMPREHENSIVE GROUND-WATER MONITORING EVALUATION WORKSHEET

The following worksheets have been designed to assist the enforcement officer/
technical reviewer in evaluating the ground-water monitoring system an owner/operator
uses to collect and analyze samples of ground water. The focus of the worksheets is
technical adequacy as it relates to obtaining and analyzing representative samples of
ground water. The basis of the worksheets is the final RCRA Ground Water Monitoring
Technical Enforcement Guidance Document which describes in detail the aspects of
ground-water monitoring which EPA deems essential to meet the goals of RCRA.
Appendix A is not a regulatory checklist. Specific technical deficiencies in the
monitoring system can, however, be related to the regulations as illustrated in Figure 4.3
taken from the RCRA Ground-Water Monitoring Compliance Order Guide (COG)
(included at the end of the appendix). The enforcement officer, in developing an
enforcement order, should relate the technical assessment from the worksheets to the
regulations using Figure 4.3 from the COG as a guide.

H. Evaluation of the Facility's Detection Monitoring Program	
1. Placement of Downgradient Detection Monitoring Wells	
a. Are the ground-water monitoring wells or clusters located immediately adjacent to the waste management area?      b. How far apart are the detection monitoring wells?  C. Does the control of the detection monitoring wells?	Y
c. Does the owner/operator provide a project of	100-50C'
c. Does the owner/operator provide a rationale for thelocation of each monitoring well or cluster?  d. Does the owner/operator provide a rationale for thelocation of each monitoring	Y
d. Does the owner/operator identified the well screenlengths of each monitoring well or clusters?  e. Does the owner/operator considerations and the owner/operator considerations are considerated as the owner/operator consideration and the owner/operator identified the well screenlengths of each monitoring of the owner/operator identified the well screenlengths of each monitoring of the owner/operator identified the well screenlengths of each monitoring of the owner/operator identified the well screenlengths of each monitoring of the owner/operator identified the well screenlengths of each monitoring of the owner/operator identified the well screenlengths of each monitoring of the owner/operator identified the well screenlengths of each monitoring of the owner/operator identified the well screenlengths of each monitoring of the owner/operator identified the owner/op	N
e. Does the owner/operator provide an explanation for the well screen lengths of each monitoring well orcluster?  f. Do the actual locations of monitoring well occurred to the screen lengths of the	N
f. Do the actual locations of monitoring wells orclusters correspond to those identified by the owner/operator?	
2. Placement of Upgradient Monitoring Wells	
a. Has the owner/operator documented the location of each upgradient monitoring well or cluster?  b. Does the owner/operator provide an explanation for the location(s) of the upgradient monitoring matter.	Y
upgradient monitoring wells?  c. What length screen has the owner/operator employed in the background monitoring well(s)?	Y
d. Does the owner/operator provide an explanation for the screen length(s)  chosen?	?
	N
e. Does the actual location of each background monitoring well or cluster correspond to that identified by the owner/operator?	Y
L Office Evaluation of the Facility's Assessment Monitoring Program	
1. Does the assessment plan specify:	Y
a. The number, location, and depth of wells?  b. The rationals for their places.	•
b. The rationale for their placement and identify the basis that will be used to select subsequent sampling locations and deaths in June 1	
and depute in timer assessment phases?	Y
2. Does the list of monitoring parameters include all hazardous waste constituents from the facility?	Y

e. Lots the water quality parameter lies and the	<b>Y</b> /
a. Does the water quality parameter list include other important indicators not classified as hazardous waste constituents?	
b. Does the owner/operator provide documentation for he listed wastes which are not included?	
	N
3. Does the owner/operator's assessment plan specify the procedures to be used to determine the rate of constituent migration in the

III. Review of Sample Collection Procedures		
A. Measurement of Well Depths /Elevation		
1. Are measurements of both depth to standing water and depth to the bottom of the well made?	N	
2. Are measurements taken to the 0.01 feet?		
3. What device is used?	N	_
4. Is there a reference point established by a licensed surveyor?	N/A	1
	N/A	L.
5. Is the measuring equipment properly cleaned betweenwil locations to prevent cross contamination?	N	
B. Detection of Immiscible Layers	+	_
1. Are procedures used which will detect light phase immiscible layers?	N	
2. Are procedures used which will detect heavy phase immiscible layers?	N	_
. Sampling of Immiscible Layers	, , , , , , , , , , , , , , , , , , ,	4
1. Are the immiscible layers sampled separately prior to well evacuation?	N	
2. Do the procedures used minimize mixing with watersoluble phases?	21	$\downarrow$
. Well Evacuation	N	$\frac{1}{2}$
1. Are low yielding wells evacuated to drymous?	N·	
. Are high yielding wells evacuated so that at least three casing volumes are removed?		
. What device is used to evacues the wells?	N	
. If any problems are encountered (e.g., equipmentmalfunction) are they noted in a	N/A	
resu togocok?	И	
·	ı	

E. Sample Withdrawal	Y/
1. For low yielding wells, are samples for volatiles, pH, and oxidation/reduction potential drawn first after the well recovers?	
2. Are samples withdrawn with either flurocarbon/resins or stainless steel (316, 304 or 2205) sampling devices?	+
3. Are sampling devices either bottom valve bailers or positive gas displacement bladder pumps?	
4. If bailers are used, is fluorocarbon/resin coated wire, single strand stainless steel wire, or monofilament used to raise and lower the bailer?	,
5. If bladder pumps are used, are they operated in acontinuous masner to prevent acration of the sample?	, n
6. If bailers are used, are they lowered slowly to prevent degassing of the water?	, n
7. If bailers are used, are the contents transferred to the sample container in a way that minimizes agitation and aeration?	N
3. Is care taken to avoid placing clean sampling equipment on the ground or other contaminated surfaces prior to insertion into the well?	Ñ
. If dedicated sampling equipment is not used, is equipment disassembled and thoroughly cleaned between samples?	N
O. If samples are for inorganic analysis, does the cleaning procedure include the following sequential supe:	
	1
a. Dibute acid riase (HNO, or HC1)711. If samples are for organic analysis, does the cleaning procedure include the following sequential steps:	i
. If samples are for inorganic analysis, does the cleaning procedure include the following sequential steps:	N
a. Nonphosphate detergent wash?	N
. If samples are for inorganic analysis, does the cleaning procedure include the following sequential steps:  a. Nonphosphate detergent week?  b. Tap water riase?  c. Distilled/tleionland water riase?	
. If samples are for inorganic analysis, does the cleaning procedure include the following sequential steps:  a. Nonphosphate desergent wash?  b. Tap water rings?  c. Distilled/deionized water rings?  d. Accome rings?	
. If samples are for inorganic analysis, does the cleaning procedure include the following sequential steps:  a. Nonphosphate detergent week?  b. Tap water riase?  c. Distilled/tleionland water riase?	N

	YN
12. Is sampling equipment thoroughly dry before use?	
13. Are equipment blanks taken to ensure that sample cross-contamination has not occurred?	N
14. If volatile samples are taken with a positive gas displacement bladder pump, are pumping rates below 100 ml/min?	N
F. In-situ or Field Analyses	
1. Are the following labile (chemically unstable) parameters determined in the field:	N
a pH?	I
b. Temperature?	N
c. Specific conductivity?	N N
d. Redox potential?  e. Chlorine?	N N
	<u> </u>
f. Dissolved exygen?  g. Turbidity?	N
h. Other (specify)	N N
= Value (specialy)	N N
2. For in-sim determinations, are they made after well evacuation and sample removal?	N
3. If sample is withdrawn from the well, is parameter measured from a split portion?	N
4. Is monitoring equipment calibrated according to mannufacturers' specifications and consistent with SW-8467	N
5. Is the date, procedure, and maintenance for equipment calibration documented in the field logbook?	N
Review of Sample Preservation and Handling Procedures  Sample Containers  Are samples transferred from the sampling device directly to their compatible containers?	
	N

	Y/N
2. Are sample containers for metals (inorganics) analyses polyethylene with polypropylene caps?	
3. Are sample containers for organics analysis glass bottles with fluorocarbonresin-	N
4. If glass bottles are used for metals samples are the caps fluorocarbonresin-lined?	N
5. Are the sample containers for metal analyses cleanedusing these sequential steps:	N
a. Nonphosphate detergent wash?	N
b. 1:1 mitric acid rinse?	
c. Tap water rinse?	N
d. 1:1 hydrochloric sold rinse?	N
e. Tap water rinse?	N
f. Distilled/deionized water rings?	N
	N
5. Are the sample containers for organic analyses cleaned using these sequential steps:	
a. Noophosphate desergent/hot water wash?	N
o. 1ap water ringe?	<u></u>
c. Distilled/deionized water ringe?	N
4. Acetone ringe?	Ň
e. Pesticide-grade hexane rinse?	N
	N
Are trip blanks used for each sample container type to verify cleanliness?	N

6. Downgradient monitoring wells must be constructed so as to yield samples that are representative of in-situ groundwater quality.

See No. 4 above.

- 7. Samples from background and downgradient wells must be properly collected and analyzed.
- failure to evacuate stagnant water from the well before sampling.
- failure to sample wells within a \$26 reasonable amount of time after well \$26 evacuation.
- improper decisions regarding filtering or son-filtering of samples prior to analysis (e.g., use of filtration on. samples to be analyzed for volatile organics).
- see of an inappropriate sampling device.
- use of improper sample preservation techniques.
